

An aerial photograph showing a long, narrow strip of land, the Sand Engine, extending from the sea into the hinterland. The land is mostly sandy and flat, with some greenery and infrastructure visible. The sea is a deep blue, and the sky is a pale blue. The land strip is flanked by water on both sides, with some smaller water bodies and dunes visible along its length.

Building/Working/Designing with Nature: the Sand Engine experience

Building/Working/Designing with Nature (BwN, WwN, DwN)

My personal definition: BwN = integrating natural system elements in "engineered" environments"

- NEW? Hmmm ... not really: see e.g. 1000 years of Wadden Sea reclamations
- NEW! Yes, regarding scale and technology
- First promoting discipline: landscaping

LA PLAYA, HACE CUARENTA AÑOS, ERA OTRA COSA... SE ENCONTRABA EN ESTADO SALVAJE, CON CAMPO DE DUNAS Y VEGETACIÓN BAJA HASTA QUE LLEGABAS A LA PLAYA. ¡DABA GUSTO VERLA!

Años 40 y 50: Situación Original.

From 1940 to 1950: Original Situation.

Años 60 y 70: Urbanización Masiva.

From 1960 to 1970: Massive Urban Development.

PERO MÁS TARDE LA ACCIÓN DEL HOMBRE FUE OCUPANDO EL BORDE GSTERB CON EDIFICIOS Y OBRAS, LO QUE PROVOCÓ LA PROGRESIVA DEGRADACIÓN DEL PAISAJE Y LA DESAPARICIÓN DE LA PLAYA

¡QUE DESASTRE! ESTO NI ES PLAYA NI ES NADA

URBANIZACION DE LA COSTA.
URBAN DEVELOPMENT OF THE COAST.

PARA PROTEGERSE DE LA INVASIÓN DEL MAR Y DEL DEGRADO DEL PAISAJE SE PUEDE CONSTRUIR UN MURO CON UNA PROTECCIÓN DE ESCOLLERA QUE, EN CUALQUIER CASO, REQUIERE GRAN INVERSIÓN Y ALTOS COSTOS DE MANTENIMIENTO.

Opción 1: Solución Rígida

Option 1: Rigid Solution

- Defensa artificial de la costa: muros, escolleras, espigones.
- Altos costes de mantenimiento y reparación:
 - defensas costeras
 - edificaciones junto al mar
- Efectos negativos en la costa adyacente.
- No se recupera el escenario natural.
- Escasas perspectivas de futuro.

-Artificial defense of the coast: walls, rockfills, spurs.
-High costs of maintenance and repair:
• coastal protections
• buildings near the sea
-Negative effects on adjacent coast.
-The natural scenery is not recovered.
-Slim future prospects.

Opción 2: Solución Blanda

Option 2: Soft Solution

- Defensa artificial de la costa: aportación de arena.
- Altos costes de mantenimiento y reparación:
 - alimentación periódica
 - edificaciones junto al mar
- Recuperación parcial del escenario natural.
- Eficacia a medio plazo

-Artificial defense of the coast: sand deposits.
-High costs of maintenance and repair:
• periodic supply
• buildings near the sea
-Partial recovery of the natural scenery.
-Medium-term efficiency.

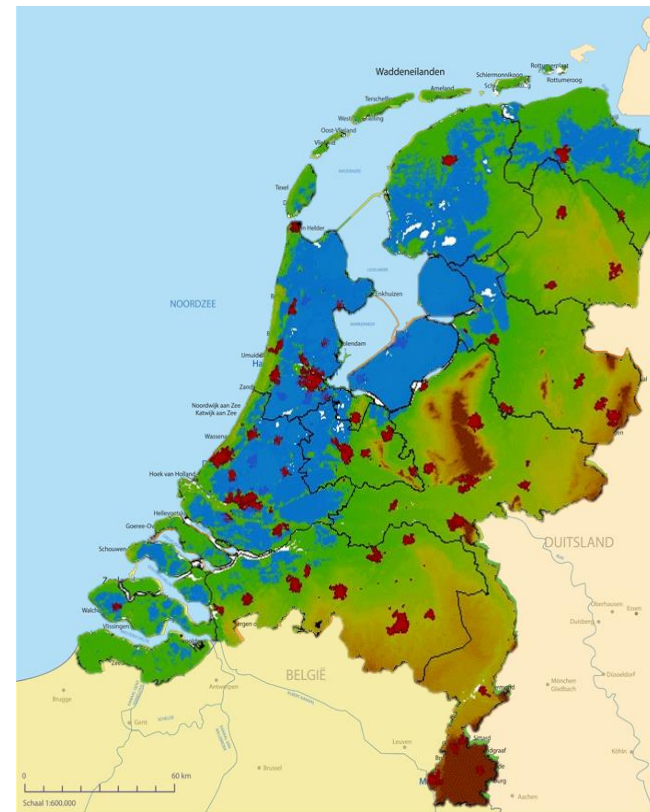

OPCIONES DE ACTUACION.
OPTIONS OF ACTIONS.

Pollensa Beach. Balearic Islands.

The Dutch Coast

'coastal squeeze'

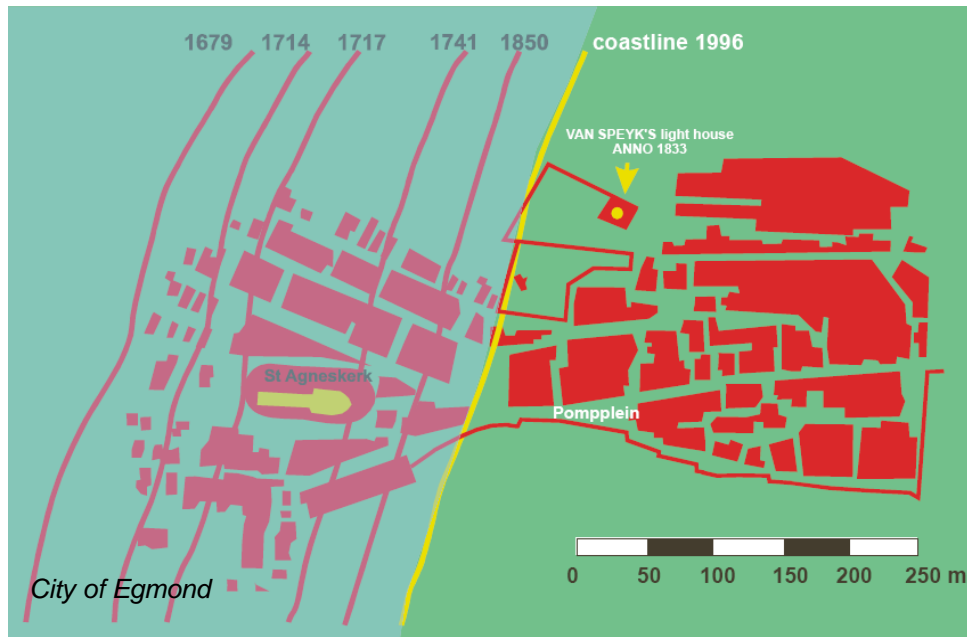

Historic perspective

Shortage of natural sediment

Consequence: Structural erosion

Solution: ??

Traditional 'hard' solutions

Solution 1.0

'Soft solutions

Nourishments

Development of nourishment strategy

since the nourishments were used as main mitigation measure

Increase in volume

Annual added sand volumes:

- Since 1990: 6 mln m³/yr
- Since 2001: 12 mln m³/yr

Prospect future : 40-85 mln m³/yr !!

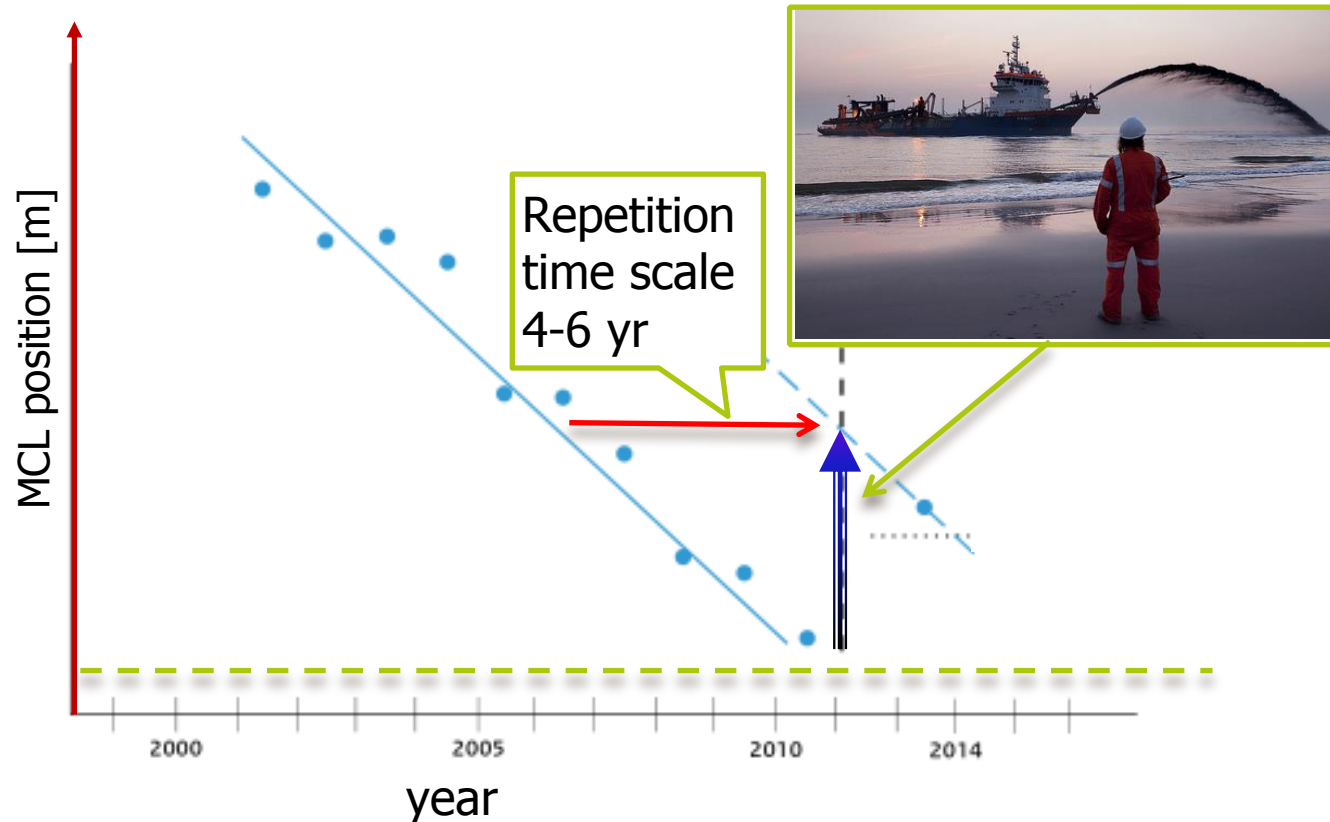

Example of town of Ter Heijde:
Nourishments in years

1986-1993-1995-1997-2001-2003
-2004-2005-2009-2011

Change in design

‘Soft’ protection strategy

Intervention (nourishment) when the momentary coastline (MCL) starts to move landward of a defined threshold

Spanjaards Duin: ontwikkeling 2008-2018

The use of natural forces in our advance

building with nature?

*cannot we let
nature do part
of the work ...*

*while creating new
new opportunities
for itself?*

young dune formation

1. Tendency towards larger-scale nourishments
2. Extra functions nourishments (nature, surfing)
3. Can we have nature do part of the work?
4. Increasing the intervention interval

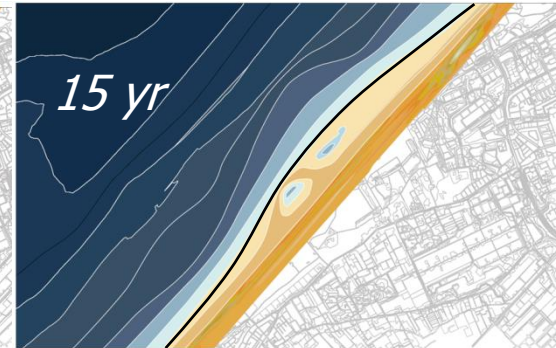

The Sand Engine!

Objectives:

1. Extra Safety
2. Nature area / 'Quality of living'
3. Innovation

Peninsula alone 17.23 million m³

Envisioned lifetime 10-20 yrs

Construction, ~ 3 months

Monitoring the Zandmotor

Topography

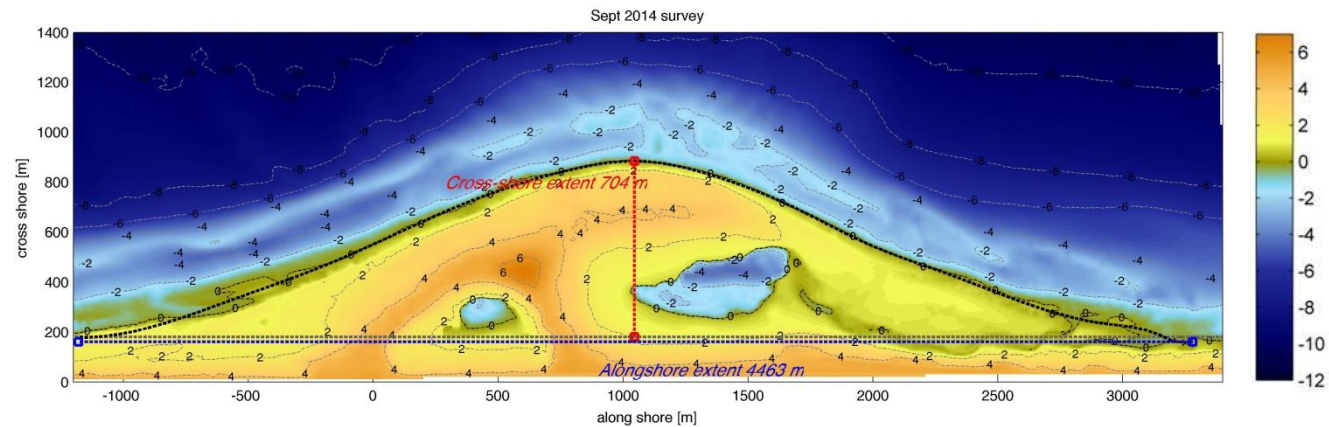

Animation surveys

Bodemligging Zandmotor, survey August 2011

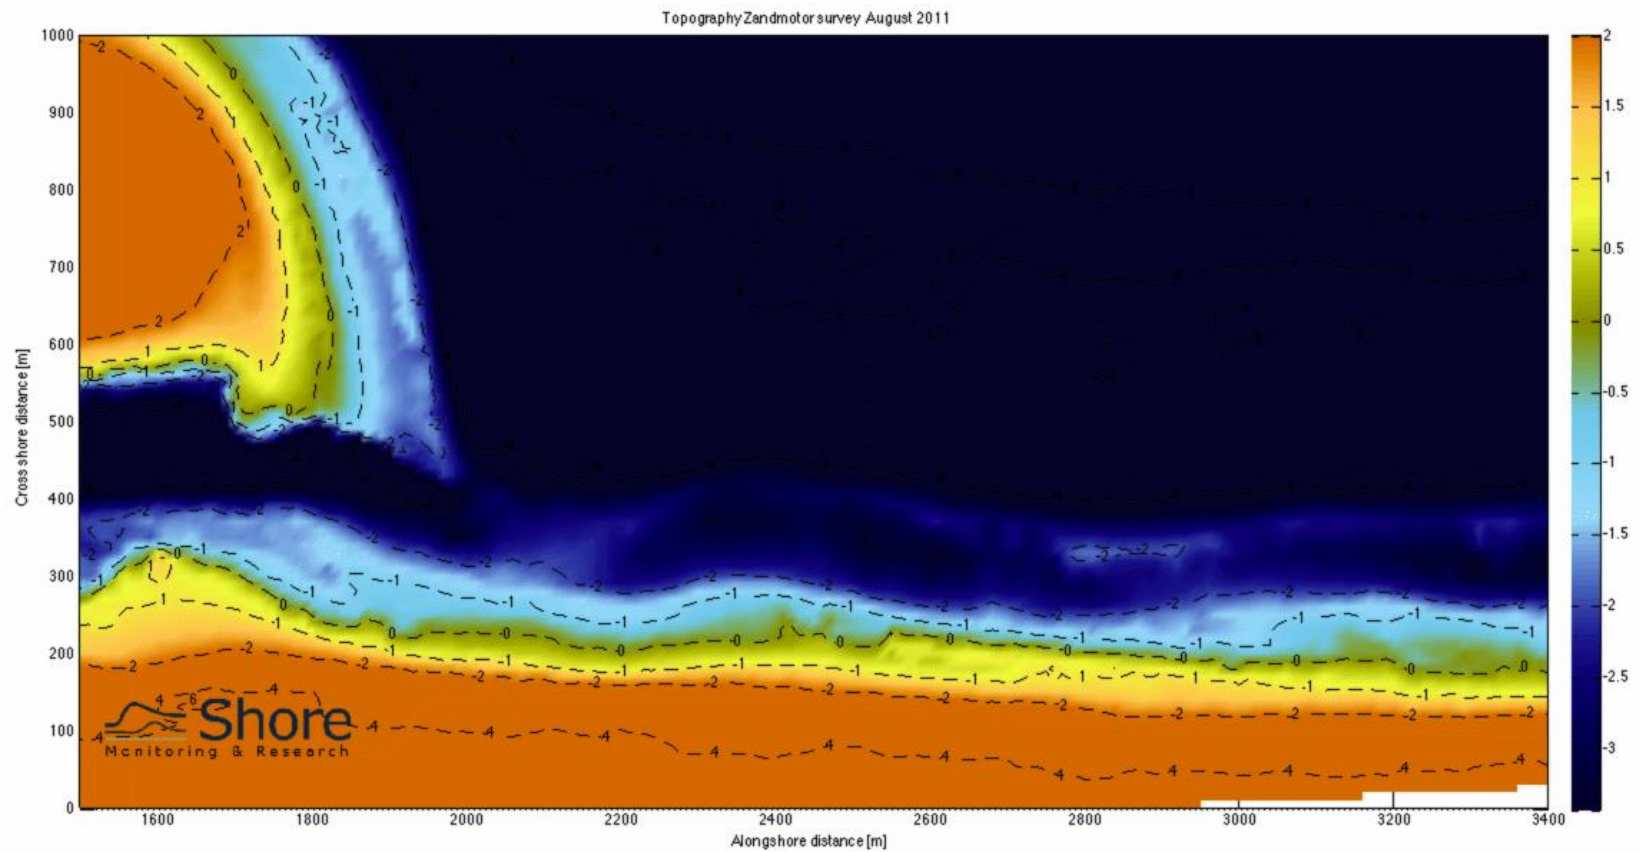

Morphology: General observations

- Erosion seaward side ('tip')
- Elongation alongshore of $\sim 2\text{km}$
- Sedimentation southern end
- Spit and channel formation near lagoon
- Symmetry

Spit and channel formation near lagoon

Volume change

Morphology observations

- It is feeding!
- Rapid change in the outline (within the first months)
- Quickly turning into almost diffusion case (skewed normal distribution)
- Feeding primarily during the energetic months, mild months show mostly cross shore change

Building with Nature

= Unexpected dynamics

> More uncertainty >>> **Monitoring, Data & Research essential**

Multi disciplinary pilot and monitoring

Motivation for interdisciplinary research

- Large signal to noise ratio
- Multi-functionality requires interdisciplinary science
- End-user involvement in definition of research questions

NatureCoast Research Program

- Interdisciplinary research project
- Funded by STW – Dutch Science Foundation (5.5 mln €)
- 6 universities, 12 PhDs + 3 postdocs
- Strong involvement of end-users
- Builds on MEP, EFRO and NEMO (3 PhDs)
- International collaboration with universities (MegaPex)

Governance

Province South Holland key figure

- Ministry invited provinces for integrated ideas
- Province of ZH was Initiator
- Opportunity-oriented instead of problem-oriented
- Convincing all stakeholders

What was unexpected?

- Dunes need more time to develop and lower growth rates
- Vegetation needs more time to develop
- Intertidal area is main sand source for aeolian transport
- Channel breach cycle is longer than expected (5 years)
- Steep slopes and erosional pits in channel
- Cliff formation
- Liquefaction / quick sand

Utilizing Integrated Knowledge

1. Through Ecosystem Services in Design
2. Develop integrated tools for quantification
3. Verification through international cases
4. Exploring governance setting

Monitor

Consequences of Sand Motor design to human well-being

- Shape (hook, island, parallel)
- Extent, height, orientation
- Grain size of material
- Other (chemical) properties
- (Permanent) infrastructure
- Management (raking, etc.)

Erosion Prevention

Coastal Protection

Recreation

Fresh water provision

Habitat provision

Inspiration for
culture, art & design

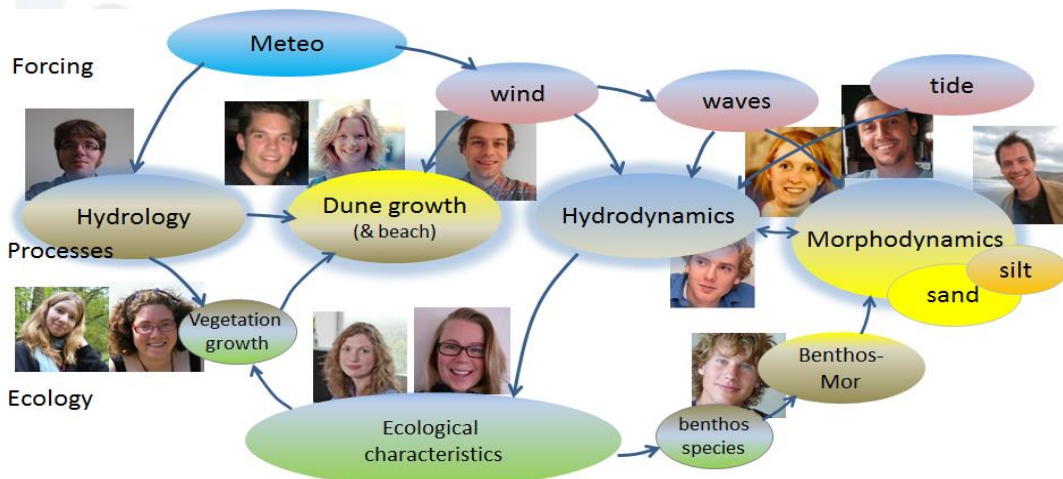

and others..

Arjen Luijendijk
Post-doc at Delft Univ of Technology /
Deltares

Integrated tools for ESS quantification

- Long-term predictions with coupled models
- Combining aeolian transports, morphology, groundwater and vegetation, habitat development
- Input for quantification of Ecosystem Services

Cases / applications

Vera Vikolainen
Post-doc at Twente University

Viability of sandy solutions in different governance settings

- Norfolk, UK
- Barriers and opportunities
in the governance context

Spinoffs

- Active involvement of end-users
- Innovative measuring techniques:
 - WaveDroid
 - Drone
 - Jetski (Shore)
- Integrated models (open-source)
- Data Management System
- MOOC → BwN in educational programs
- OpenData

Field Experiments

MEGAPEX 2014

Beach & Dunes

Sediment transport measurements across the beach

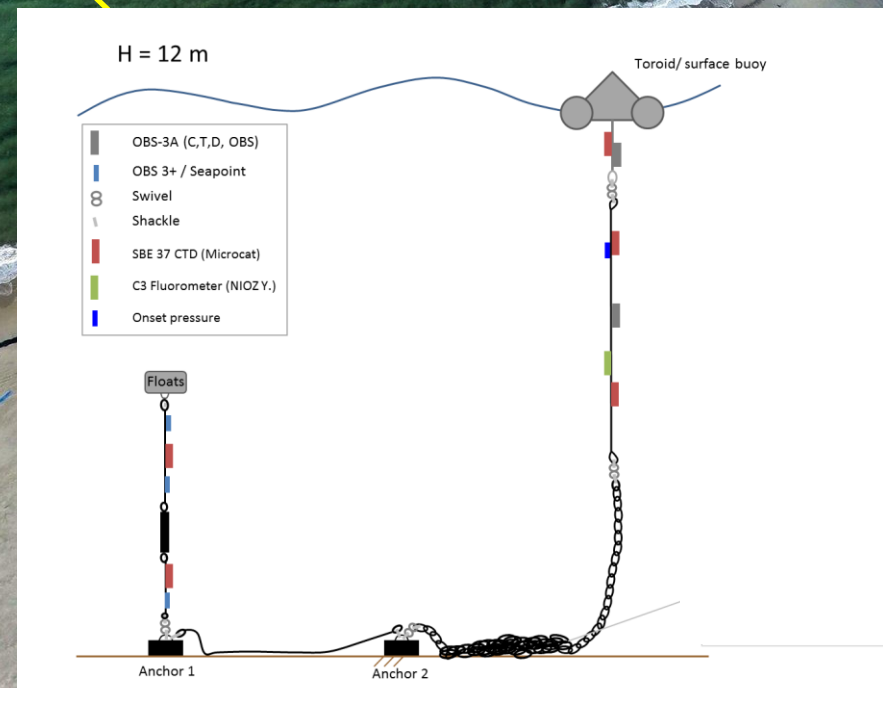

Drifter flow measurements

Free floating buoys with GPS

Offshore

Dye & drone measurements

Measure currents near the coast

Dye & drone measurements

Global challenge

- Impact of Sea Level Rise (SLR) on coastal systems: beach/dune/barrier coasts, salt marshes and mangroves, deltas/estuaries/lagoons
- Impact of Weather Pattern changes on coasts: extreme events, structural wind direction changes
- Impact of Weather Pattern changes on river catchments: rainfall and drought changes

NB: in all cases we need to consider climate change drivers AND non climate change drivers, e.g. coastal squeeze

Sea level rise causes coastal retreat: 3 mm slr/yr gives a retreat of 30 cm/yr without compensation

Fringing habitats need space to breath (besides absorbing the impact of sea level rise)

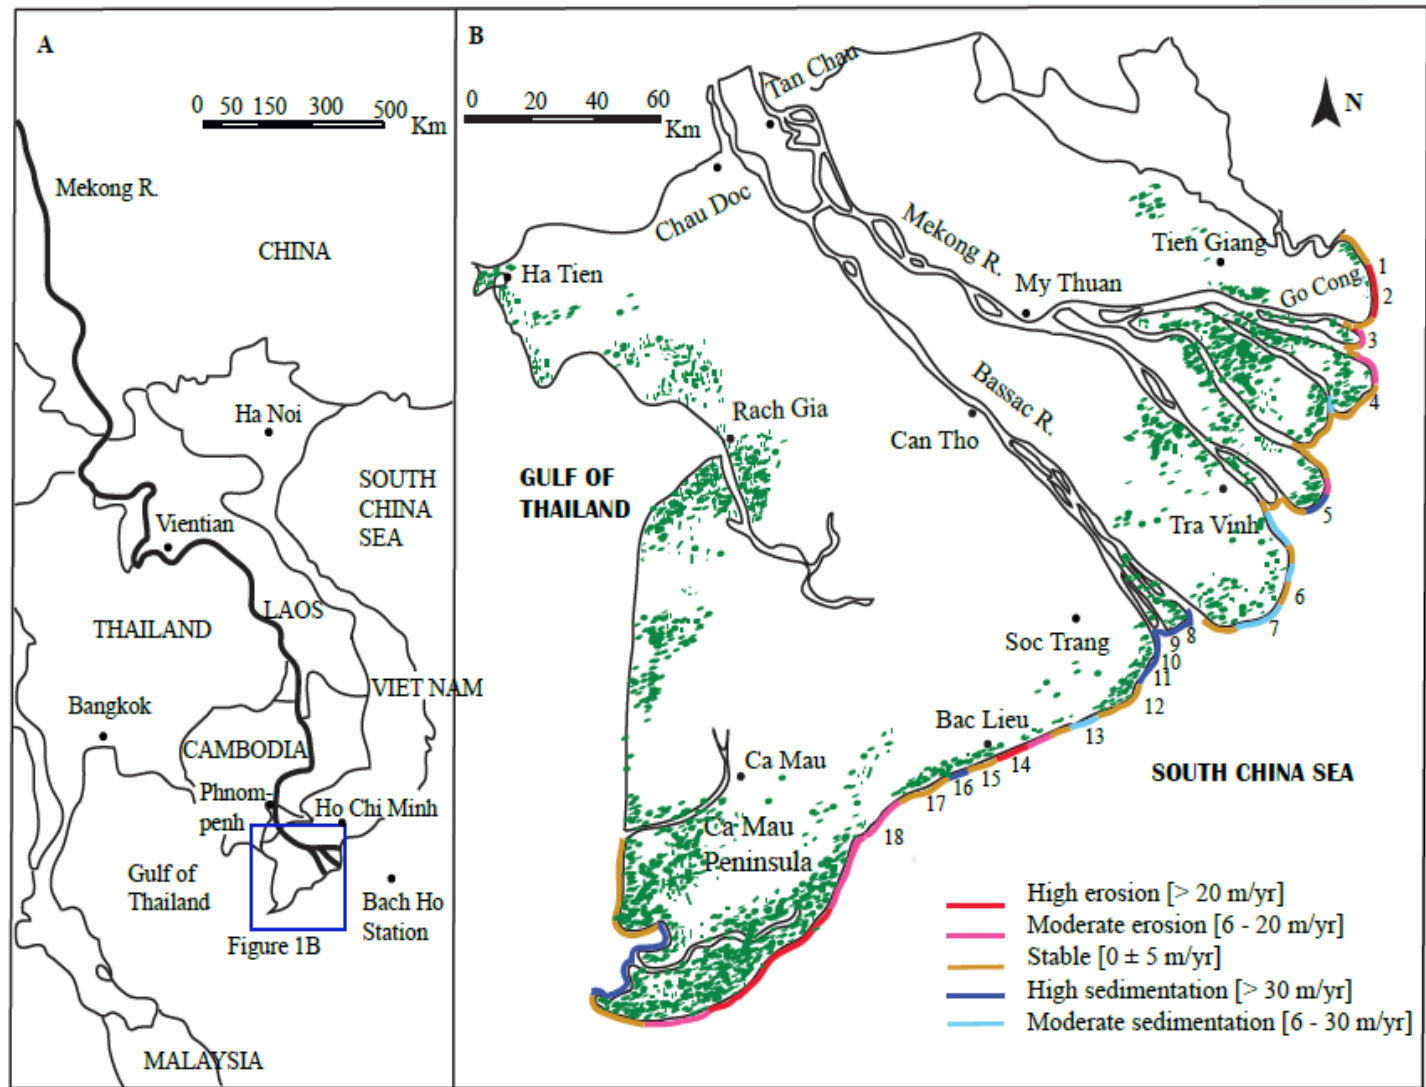

At least as important to cope with slr is to prevent Coastal Squeeze

Fringing coastal habitats suffer from squeeze:

- Dune, beach and beach barrier habitats
 - Salt marsh habitats
 - Mangrove habitats
-
- A classic example of beach and dune squeeze: Spain
 - Mangrove squeeze in the Mekong delta

Coastal mangrove squeeze in the Mekong delta

Soc Trang Province

Endangered dyke in Soc Trang Province

Abundant sea dike construction

For locations where sediment source is not restricted

2006

Fish farm

2010

Extented

Extented

Fish farm

Squeeze hypothesis

When either the primary or the secondary dike is too close to the non-vegetated foreshore, erosion is usually occurring and the health of the mangrove forest is under stress

COASTAL SQUEEZE

- Fringing habitats need space to 'operate'
- 'Operate' means:
 - Absorb extreme events
 - Allow for cyclic rejuvenation
 - Absorb relative sea level rise
- The habitat needs space so

Nourish or retreat?

- Sediment availability is not trivial
- Is retreat an option to resolve this?
- Technically: YES
- Politically: ???

Thank you

M.J.F.Stive@TUDelft.nl

@WaterTUDelft

Building with Nature

=
Unexpected dynamics

Combining surveys

Topography maps

In conclusion: Squeezing of land-water and water-water transitions needs our attention

- Beside coastal also in rivers along the fringing banks, or upstream and downstream of dams
- Also in estuaries along the banks or due to damming separating fresh and salt water bodies
